

**RAD HARD ULTRA LOW  
VOLTAGE ADJUSTABLE  
POSITIVE LINEAR REGULATOR**

**5950RH**

**FEATURES:**

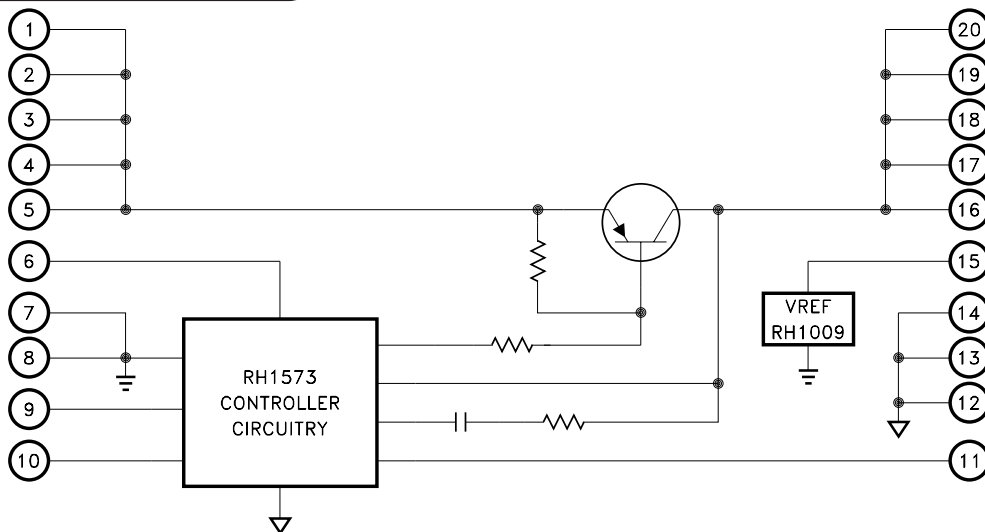

- Manufactured using  Space Qualified RH1009 and RH1573 Die
- Total Dose Hardened to 100 Krads(Si) (Method 1019.7 Condition A)
- Total Dose Test Reports to 450 Krads(Si) available on website.
- Output Adjustable Down to Near Zero
- External Shutdown/Reset Function
- Latching Overload Protection
- Adjustable Output Using External Resistors
- Output Current Limit
- Surface Mount Package Available with Lead Forming
- Low Input Voltage for Maximum Efficiency
- Up to 5A Output Current

**DESCRIPTION:**

The MSK5950RH is a radiation hardened adjustable linear regulator capable of delivering 5.0 amps of output current. The typical dropout is only 0.11 volts at 1 amp. An external shutdown/reset function is ideal for power supply sequencing. This device also has latching overload protection that requires no external current sense resistor. The MSK5950RH is radiation hardened and specifically designed for many space/satellite applications. The device is packaged in a hermetically sealed 20 pin flatpack that can be lead formed for surface mount applications.

**EQUIVALENT SCHEMATIC**

**TYPICAL APPLICATIONS**

- Satellite System Power Supplies
- Switching Power Supply Post Regulators
- Constant Voltage/Current Regulators
- Microprocessor Power Supplies

## NOTES:

- ① Unless otherwise specified, V<sub>BIAS</sub> = V<sub>IN</sub> = 5.0V, R<sub>1</sub> = 1.62K, R<sub>REF</sub> = 249W (see figure 2), V<sub>SHUTDOWN</sub> = 0V and I<sub>OUT</sub> = 10mA.
- ② Guaranteed by design but not tested. Typical parameters are representative of actual device performance but are for reference only. Not applicable to post irradiation performance.
- ③ Industrial grade devices shall be tested to subgroups 1 and 4 unless otherwise requested.
- ④ Military grade devices ("H" suffix) shall be 100% tested to subgroups 1,2,3 and 4.
- ⑤ Subgroup 5 and 6 testing available upon request.4
- ⑥ Subgroup
 

1, 4	T <sub>A</sub> = +25°C
2, 5	T <sub>A</sub> = +125°C
3, 6	T <sub>A</sub> = -55°C
- ⑦ Output current limit is tested with a low duty cycle pulse to minimize junction heating and is dependent on the values of V<sub>IN</sub>, V<sub>OUT</sub> and case temperature. See Typical Performance Curves.
- ⑧ Continuous operation at or above absolute maximum ratings may adversely effect the device performance and/or life cycle.
- ⑨ Pre and post irradiation limits @ 25°C, up to 100 Krad TID, are identical unless otherwise specified. Post irradiation performance is guaranteed by design with a 2X radiation design margin.

## APPLICATION NOTES

### PIN FUNCTIONS

VIN A,B,C,D,E - These pins provide the input power connection to the MSK5950RH. This is the supply that will be regulated to the output. All five pins must be connected for proper operation.

VBIAS - This pin provides power to all internal circuitry including bias, start-up, thermal limit and overcurrent latch. VBIAS voltage range is 2.9V to 7.5V. VBIAS should be kept greater than or equal to VIN.

VREF - Internal general purpose 2.5V shunt regulator that will operate over a wide current range while maintaining good stability. This reference voltage is used along with the feedback voltage to configure the desired output voltage. The reference will maintain good regulation as long as  $0.4 \leq I_{SHUNT} \leq 10\text{mA}$ . The shunt current is derived from a resistor tied to VIN or VBIAS. The resistor must supply both the minimum shunt current of 400 $\mu\text{A}$  (1mA recommended) and the current required by the output voltage feedback divider network, between 2 and 2.5mA total is typically sufficient. A constant current diode (CCR) may be used in place of the resistor to minimize variations in  $I_{SHUNT}$  due to line voltage variations.

Resistor calculation example:

VBIAS=3.3V $\pm$ 10%  
VOUT=0.9V

First determine the required current by selecting R2 in the feed back divider, typically between 1.0 and 1.2K $\Omega$ ; see the output voltage selection paragraph. Using standard value 0.1% tolerance resistors, the nominal output will be 0.9V with R2=1.07K and R1=316 $\Omega$ . The current in the divider will be equal to  $(VREF-V_{FDBK})/R2$  or 1.154mA nominal and 1.2mA worst-case in this example.

The total current required is the sum of the worst-case divider current plus the VREF shunt current. The minimum shunt current is 400 $\mu\text{A}$  but 1mA is recommended. Using the recommended 1mA the minimum current required in RREF is 2.2mA.

The maximum resistor value to source the required current is equal to  $(VBIAS \text{ min}-VREF) / 2.2\text{mA}$  or 218 $\Omega$  for this example. The maximum current in the reference must not exceed 10mA, the absolute maximum allowable bias voltage is 10mA\*RREF+VREF(min) or 4.67V for this application.

The designer must also consider that the feedback divider will provide a resistive connection from the source (VIN or VBIAS) to the output even when the regulator is disabled. A minimum load resistor can be used to draw the voltage down in the event this poses a problem. A 90 $\Omega$  resistor will sink 10mA during operation and pull the output well below 200mV when the regulator is disabled in this application.

VREF can be used as a precision 2.5V reference for other parts of the circuit as long as circuit loading, shunt current and parasitics are carefully considered.

GND1 - SIGNAL GROUND - Internally connected to the reference ground, these pins should be connected externally by the user to the circuit ground and the GND2 pins.

VOUT A,B,C,D,E - These are the output pins for the device. All five pins must be connected for proper operation.

GND2 - POWER GROUND - Internally connected to the pass element drive circuitry, these pins should be connected externally by the user to the circuit ground and the GND1 pins.

LATCH - The MSK5950RH LATCH pin is used for both current limit and thermal limit. A capacitor between the LATCH pin and ground sets a time out delay in the event of an over current or short circuit condition. The capacitor is charged to approximately 1.6V from a 7.2 $\mu\text{A}$  (nominal) current source. Exceeding the thermal limit will charge the latch capacitor from a larger current source for a near instant shutdown. Once the latch capacitor is charged the device latches off until the latch is reset. Momentarily pull the LATCH pin low, toggle the shutdown pin high then low or cycle the power to reset the latch. Toggling the shutdown pin or cycling the bias power both disable the device during the reset operation (see SHUTDOWN pin description). Pulling the LATCH pin low immediately enables the device for as long as the LATCH pin is held low plus the time delay to re-charge the latch capacitor whether or not the fault has been corrected. Disable the latch feature by tying the LATCH pin low. With the LATCH pin held low the thermal limit feature is disabled and the current limit feature will force the output voltage to droop but remain active if excessive current is drawn.

SHUTDOWN - There are two functions to the SHUTDOWN pin. It may be used to disable the output voltage or to reset the LATCH pin. To activate the shutdown/reset functions the user must apply a voltage greater than 1.3V to the SHUTDOWN pin. The voltage applied to the SHUTDOWN pin can be greater than the input voltage. The output voltage will turn on when the SHUTDOWN pin is pulled below the threshold voltage. If the SHUTDOWN pin is not used, it should be connected to ground.

FB - The FB pin is the inverting input of the internal error amplifier. The non-inverting input is connected to an internal 1.265V reference. This error amplifier controls the drive to the output transistor to force the FB pin to 1.265V. An external resistor divider is connected to the output, FB pin, VREF and VIN to set the output voltage.

### POWER SUPPLY BYPASSING

To maximize transient response and minimize power supply transients it is recommended that a 33 $\mu\text{F}$  minimum tantalum capacitor is connected between VIN and ground. A 0.1 $\mu\text{F}$  ceramic capacitor should also be used for high frequency bypassing.

### OUTPUT CAPACITOR SELECTION

Low ESR output capacitors are required to maintain regulation and stability. Four CWR29FB227 (AVX PN TAZH227K010L) tantalum capacitors in parallel with ceramic decoupling capacitors (0.1 $\mu\text{F}$  typical) provides sufficient gain and phase margin for most applications. The maximum ESR specification for the CWR29FB227 capacitor is 180m $\Omega$  at 100kHz and is sufficient for many applications. It has been found through full WCCA on the MSK5820RH-1.5 that screening for a maximum ESR of 57m $\Omega$  ensures EOL stability criteria to be met for many applications with the most stringent requirements. Analysis of the final design is recommended to ensure stability requirements are met.

## APPLICATION NOTES CONT'D

### THERMAL LIMITING

The MSK5950RH control circuitry has a thermal shutdown temperature of approximately 150°C. This thermal shutdown can be used as a protection feature, but for continuous operation, the junction temperature of the pass transistor must be maintained below 150°C. Proper heat sink selection is essential to maintain these conditions. Exceeding the thermal limit activates the latch feature of the MSK5950RH. See LATCH pin description for instructions to reset the latch or disable the latch feature.

### START UP OPTIONS

The MSK5950RH starts up and begins regulating immediately when VBIAS and VIN are applied simultaneously. Applying VBIAS before VIN starts the MSK5950RH up in a disabled or latched state. When starting in a latched state the device output can be enabled either by pulling the latch pin low to drain the latch capacitor or pulsing the shutdown pin high. The shutdown pulse duration is partially dependent upon the size of the latch capacitor and should be characterized for each application; 30uS is typically adequate for a 1uF latch capacitor at 25°C. A momentary high pulse on the shutdown pin can be achieved using the RC circuit below if VIN rises rapidly. The resistor and capacitor must be selected based on the required pulse duration, the rise characteristic of VIN and the shutdown pin threshold (see shutdown pin threshold and current curves).

The shutdown pin can be held high and pulled low after VIN comes up or the latch pin held low and released after VIN comes up to ensure automatic startup when applying VBIAS before VIN. Either of the basic circuits below can be adapted to a variety of applications for automatic start up when VBIAS rises before VIN.

### OVERCURRENT LATCH-OFF/LATCH PIN CAPACITOR SELECTION

As previously mentioned, the LATCH pin provides over current/output short circuit protection with a timed latch-off circuit. Reference the LATCH pin description note. The latch off time out is determined with an external capacitor connected from the LATCH pin to ground. The time-out period is equal to the time it takes to charge this external capacitor from 0V to 1.6V. The latch charging current is provided by an internal current source. This current is a function of bias voltage and temperature (see latch charging current curve). For instance, at 25°C, the latch charging current is 7.2µA at VBIAS = 3V and 8µA at VBIAS = 7V.

In the latch-off mode, some additional current will be drawn from the bias supply. This additional latching current is also a function of bias voltage and temperature (see typical performance curves).

The MSK5950RH current limit function is directly affected by the input and output voltages. Custom current limit is available; contact the factory for more information.

### HEAT SINK SELECTION

To select a heat sink for the MSK5950RH, the following formula for convective heat flow may be used.

Governing Equation:

$$T_J = P_D \times (R_{\theta JC} + R_{\theta CS} + R_{\theta SA}) + T_A$$

Where

- $T_J$  = Junction Temperature
- $P_D$  = Total Power Dissipation
- $R_{\theta JC}$  = Junction to Case Thermal Resistance
- $R_{\theta CS}$  = Case to Heat Sink Thermal Resistance
- $R_{\theta SA}$  = Heat Sink to Ambient Thermal Resistance
- $T_A$  = Ambient Temperature

$$\text{Power Dissipation} = (V_{IN} - V_{OUT}) \times I_{OUT}$$

Next, the user must select a maximum junction temperature. The absolute maximum allowable junction temperature is 150°C. The equation may now be rearranged to solve for the required heat sink to ambient thermal resistance ( $R_{\theta SA}$ ).

## APPLICATION NOTES CONT'D

### Example:

An MSK5950RH is connected for  $V_{IN} = +3.3V$  and  $V_{OUT} = +1.2V$ .  $I_{OUT}$  is a continuous 1A DC level. The ambient temperature is  $+25^{\circ}C$ . The maximum desired junction temperature is  $+125^{\circ}C$ .

$$R_{\theta JC} = 8.4^{\circ}C/W \text{ and } R_{\theta CS} = 0.15^{\circ}C/W \text{ for most thermal greases}$$

$$\text{Power Dissipation} = (3.3V - 1.2V) \times (1A)$$

$$= 2.1\text{Watts}$$

Solve for  $R_{\theta SA}$ :

$$R_{\theta SA} = \left[ \frac{125^{\circ}C - 25^{\circ}C}{2.1W} \right] - 8.4^{\circ}C/W - 0.15^{\circ}C/W$$

$$= 39^{\circ}C/W$$

In this example, a heat sink with a thermal resistance of no more than  $39^{\circ}C/W$  must be used to maintain a junction temperature of no more than  $125^{\circ}C$ .

### START UP CURRENT

The MSK5950RH sinks increased current during startup to bring up the output voltage. Reference the "Saturated Drive Current vs. Input Voltage" graph in the typical performance curves of this data sheet and the "Understanding Startup Surge Current With RH1573 Based Rad Hard LDO Regulators" application note in the application notes section of the TTM Technologies Web site for more information.

### TOTAL DOSE RADIATION TEST PERFORMANCE

Radiation performance curves for TID testing have been generated for all radiation testing performed by TTM Technologies. These curves show performance trends throughout the TID test process and are located in the MSK5950RH radiation test report. The complete radiation test report is available in the RAD HARD PRODUCTS section on the TTM Technologies website.

### TYPICAL APPLICATIONS CIRCUIT

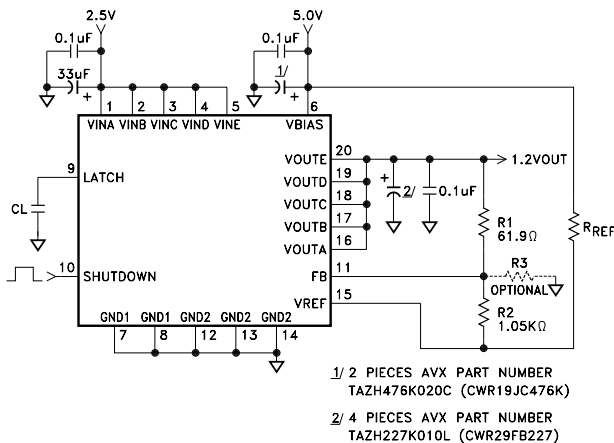

FIGURE 1

### OUTPUT VOLTAGE SELECTION

The MSK5950RH output voltage can be adjusted from 0 to 5V. Three different resistor network schemes are used depending on the required output voltage level.

For output voltages below the minimum feedback voltage tolerance of 1.225V, R3 as shown in Figure 1 can be omitted. Output voltage can be calculated as follows:

Given:

$$V_{FB} = 1.265V$$

$$V_{REF} = 2.5V$$

$$V_{OUT} = V_{FB} - ((V_{REF} - V_{FB})/R2) R1$$

For convenience Table 1 below provides standard 0.1% tolerance resistor values required to achieve several output voltages based on nominal feedback voltage, R3 is omitted.

OUTPUT VOLTAGE (V)	R2 (Ω)	R1 (Ω)
1.10	1.01K	135
1.05	1.00K	174
1.00	1.00K	215
0.95	1.00K	255
0.90	1.07K	316
0.85	1.00K	336
0.80	1.04K	392
0.75	1.00K	417
0.70	1.09K	499
0.65	1.05K	523
0.60	1.02K	549
0.55	1.07K	619
0.50	1.14K	706

For output voltages close to the feedback voltage tolerance of 1.225V - 1.305V, a three resistor network may be used to improve adjustment capabilities and trim out initial feedback voltage tolerances. Reference Figure 1.

$$V_{OUT} = (R2R3V_{FB} + R1R3(V_{FB} - V_{REF}) + R1R2V_{FB}) / (R2R3)$$

## APPLICATION NOTES CONT'D

For output voltages above the feedback voltage the unit should be configured as shown in Figure 2.

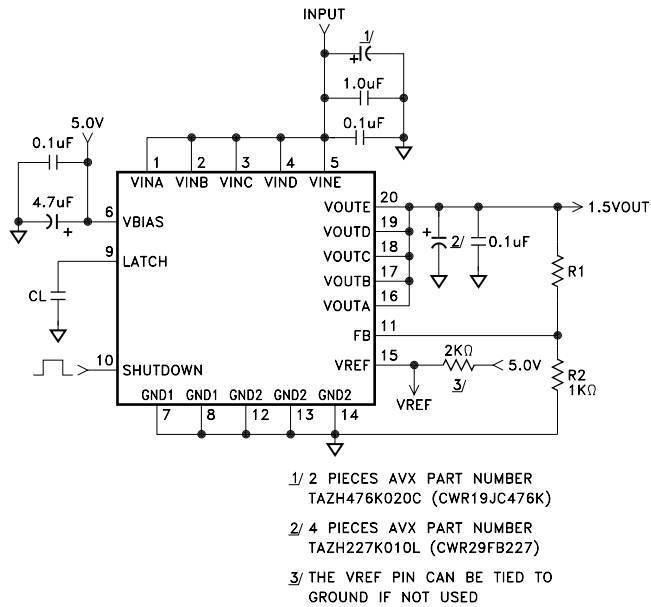

FIGURE 2

$$VOUT = 1.265 (1 + R1/R2)$$

As noted in the above typical applications circuit, the formula for output voltage selection is:

$$VOUT = 1.265 (1 + (R1/R2))$$

A good starting point for this output voltage selection is set to  $R2 = 1K$ . By rearranging the formula it is simple to calculate the final  $R1$  value.

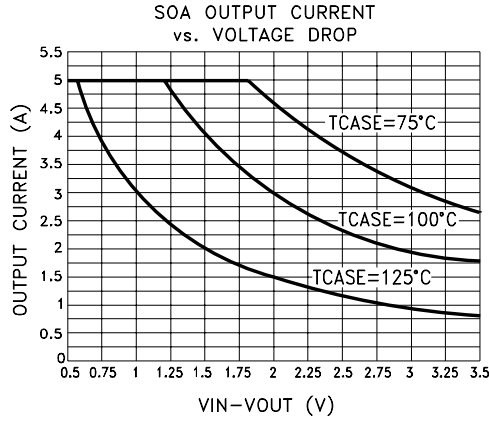

$$R1 = R2 ((VOUT/1.265) - 1)$$

Table 3 below lists some of the most probable resistor combinations based on industry standard usage,  $R3$  is omitted.

OUTPUT VOLTAGE (V)	R2 ( $\Omega$ )	R1 ( $\Omega$ )
1.5	1K	187
1.8	1K	422
2.0	1K	576
2.5	1K	976
2.5	1K	1.21K
3.3	1K	1.62K
4.0	1K	2.15K
5.0	1K	2.94K

VREF can be used as a precision 2.5V reference as long as circuit loading and shunt current are carefully considered. If VREF is not used the pin should be pulled to ground.

## REVISION HISTORY

REV	STATUS	DATE	DESCRIPTION
H	Released	01/14	Update IQ specifications and test methods to match MSK5810 and test VREF seperately. Clarify figure 2 by adding note 3. Delete incomplete performance curves on original sheet 7.
I	Released	04/14	Update bias supply voltage, feedback voltage and output voltage range specifications.
J	Released	06/14	Add maximum rating for shutdown input.
K	Released	04/16	Remove note 10 on page 2.
L	Released	07/17	Change standard TID hardness to 100 Krads(Si). Add Post RAD VREF Load REG Limit
M	Released	09/17	Update parameters to better correlate to manufacturer's pre and post RAD specs.
N	Released	04/22	Remove MIL-PRF-38535, update company name and website
